C1. FUNCTION: C1Q ASSOCIATES WITH THE PROENZYMES C1R AND C1S TO YIELD C1, THE FIRST COMPONENT OF THE SERUM COMPLEMENT SYSTEM. THE CCLLAGEN-LIKE REGIONS OF C1Q INTERACT WITH THE CA(2+) -DEPENDENT CIR(2) C1S(2) PROENZYME COMPLEX, AND EFFCIENT ACTIVATION OF C1 TAKES PLACE ON INTERACTION OF THE GLOBULAR HEADS OF C1Q WITH THE C2 FC REGIONS OF IGG OR IGM ANTIBODY PRESENT IN IMMUNE COMPLEXS.

C1- SUBUNIT: C1 IS A CALCIUM-DEPENDENT TRIMOLECULAR COMPLEX OF C1Q, R AND S IN THE MOLAR RATION OF I.2.2. THE C1 SUBCOMPONENT IS COMPOSED OF THE A AND B CIS. THE C DIMERS OF THE A AND B CIAINS, AND THREE OF WHICH ARE DISULFIDE-LINKED LINKED DIMERS OF THE C CHAINS, AND THREE OF WHICH ARE DISULFIDE-LINKED C2 LINKED DIMERS OF THE C CHAINS, IN ADDITION TO THE MAJOR A:B AND C:C DIMER BANDS, RAT, UNLIKE HUMAN C1Q, CONTAINED MINOR DIMER SPECIES.

C1- SIMILARITY: CONTAINS A COLLAGENOUS DOMAIN.

FINGETE; PROSITE; PRO113; C1Q; PARTIAL.

The peptide has primary structural homology to a bovine growth hormone sequence. It can be used to raise antibodies which will potentiate the activity of the hormone in a vertebrate. The peptide can also be used to treat an (ab)normal vertebrate to boost growth, to having above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treat an (ab)normal vertebrate to boost growth, to bring abnormally low levels of growth up to the norm, to boost milk yield, or to boost or enhance other biological effects of growth hormone. Proportion of lean meat to fat may also be enhanced. The peptide may be linked to other antigens to produce a duel effect, eg all/part of somatostatin to create anti-somatostatin antibodies which would promote growth, or to all/part of a sex hormone molecule to provide simultaneous immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Small peptide(s) contg. bovine growth hormone partial sequence - used for raising antibodies which will potentiate activity of hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Foot and mouth disease virus; bovine growth hormone; antibodies.

The peptide is an excellent inhibitor for calmodulin-dependent phosphoenzyme II (CaMKII). Sequences AAX57160-161 are CaMKII inhibitor peptides and represent specific examples of the generic peptide given above. The present sequence represents a CaMK peptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           - calmodulin-dependent phosphoenzyme
                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                              The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 37-57 of the CD44
                                                                                                                                                                                                                                       .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide has primary structural homology to a bovine growth hormone sequence. It can be used to raise antibodies which will potentiate the activity of the hormone in a vertebrate. The peptide can also be used to treat an (ab)normal vertebrate to boost growth, to bring abnormally low levels of growth up to the norm, to boost milk yield, or to boost or enhance other biological effects of growth hormone. Proportion of lean meat to fat may also be enhanced. The peptide may be linked to other antigens to produce a duel effect, ag all/part of somatostatin to create antisomatostatin antibodies which would promote growth, or to all/part of a sex hormone molecule to provide simultaneous immunocastration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                all peptide(s) contg. bovine growth hormone partial sequence - used r raising antibodies which will potentiate activity of hormone vertebrate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a heavy chain complementarity determining region (CDR) from a tumour antigen specific antibody.

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumour antigen, antibody, CDR; complementarity determining region; binding molecule identification; tumour-specific binding polypeptide; cancer therapy; heavy chain.
                                                                                                                                                                                                                                    Gaps
non-contiguous ST epitopic amino acid sequences, e.g. the present sequence, and is free of receptor binding domain sequences, can be used to transform a host cell. The transformed cell can be used for the recombinant production of the composite peptide, which can be used as an immunogen to stimulate the production of anti-pST
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying binding molecules for ligands, particularly tumour antitions - by selectively immobilising a population of binding molecules to a solid support and screening for binding to two or more ligands
                                                                                    antibodies (Ab) in pigs. Such Ab may increase the half life of co-administered pST in circulation.
                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is from human cartilage link protein which assembles into large aggregates with hyaluronan and proteoglycan core protein. The region is homologous to the proteoglycan tandem core protein. The region is homologous to the proteoglycan tandem capeat sequences found in many connective tissue proteins; it is also homologous to the gamma peptide of the precursor of IgA-protease polyprotein (IPP) of pathogenic Neisseria gnonorrhoeae strains MS11 and R16. The Neisseria IPP has marked homology to certain human proteins and has been implicated in rheumatoid arthritis and other auto-immune diseases. The polyprotein also activates proviruses, including HIV. Substances which interfere with the function of IPP from Neisseria will be useful for treating associated autoimmune diseases and viral infections. Four peptides (designated HI-H4, see AAR96890) were derived from the link protein and were assayed for binding to MHC alleles DRIDMI, DR4DW4 and DR3. Peptide HI did not bind to any of the alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     viral infection; rheumatoid arthritis; AIDS; meningococcal bacteria; immunoglobulin; human connective tissue; cartilage; link protein; proteoglycan tandem repeat; PTR; Deisseria gonorrhoeae; MHC; major histocompatibility complex; class II; self epitope; autoantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

DNA for composite peptide comprising at least 2 somatotropin epitope(s) – useful as immunogen to elicit somatotropin stabilising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an epitope comprising porcine somatotropin (pST) 1-191 residues 35-53. An expression vector containing a DNA molecule encoding a composite peptide, which comprises at least 2 non-contiguous ST epitopic amino acid sequences, e.g. the present sequence, and is free of receptor binding domain sequences, can be used to transform a host cell. The transformed cell can be used for the recombinant production of the composite peptide, which can be used as an immunogen to stimulate the production of anti-pST antibodies (Ab) in pigs. Such Ab may increase the half life of co-administered pST in circulation.
                                       Epitope comprising porcine somatotropin 1-191 residues 35-53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide encoded by Snut 2425ES DNA used in HIV DNA vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                27.6%; Score 34; DB 18; Length 19; 58.3%; Pred. No. 1e+02;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAG62702-22 represent hanatoxin-like sequences (HTLS) found in the semaphorin domain of mammalian secreted semaphorins. Hanatoxin is a tarantula toxin that selectively blocks some voltege-gated potassium and calcium channels. The HTLS is responsible for the dorsal root ganglion repulsion and growth come collapse activities associated with semaphorins. Polypeptides containing HTLS can be used to modulate the activity of calcium channels. The peptides can also be used as an antigen to generate antibodies that can then be used to modulate the activity of calcium channels by inactivating naturally occurring channel ligands. The peptides or antibodies can be used as an activity of calcium channels by inactivating naturally occurring channel ligands. The peptides or antibodies can be used as drugs to treat any condition or disease that is characterized by abnormal calcium channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide sequences that encompass the hanatoxin-like sequences of semaphorins, useful as a drugs to treat any condition or disease that is characterized by abnormal calcium channel function -

                                                                                                                                                                                                                                                        The present invention relates to a nucleotide construct with optimised codons for use as a human immunodeficiency virus (HIV) DNA vaccine. The construct uses codons from highly expressed mammalian proteins to code for each derivative of an early, primary HIV envelope gene. The first stage in the production of the construct was the cloning of an HIV envelope gene. A nucleotide sequence encoding this gene was then created using codons from highly expressed mammalian genes. The present sequence is the peptide encoded by one of the snuts (AAA49060-A49079) that were created by redesigning the nucleotide construct so that restriction enzyme sites surrounded functional regions of the sequence. The snuts were then assembled into pieces (AAA49080-A49092). Each derivative of the envelope gene (AAA49097) was then built using the pieces. The HIV DNA vaccine may be used as a prophylactic vaccine and as a charactering the pieces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

Novel analgesic short peptides from predatory cone snails for treating acute, chronic and neuropathic pain and migraines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                           Steele D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Several peptides have been characterised from Conus venoms. These include the alpha and mu conotoxins which target nicotinic acetylcholine receptors and muscle sodium channels respectively. Chronic or intractable pain as well as neuropathic pain is currently treated with a range of analgesic compounds. It is thought that the tau-conotoxins described could have applications as analgesic drugs and could be used for treating such acute, chronic and neuropathic pain as well as migraines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The venom of predatory cone snails comprises relatively small peptides which are targetted to various neuromuscular receptors and may be equivalent in their pharmacological diversity to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plants or secondary metabolites of microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 20;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                      February 21, 2002, 16:26:14; Search time 12.47 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3,
